## TEST COMPLETE TOOLS

### Introduction

- ✓ **TestComplete**, developed by SmartBear Software, offers support to a wide range of technologies such as .Net, Delphi, C++Builder, Java, Visual Basic, HTML5, Flash, Flex, Silverlight Desktop, The Web and Mobile systems.
- ✓ TestComplete helps testers develop their test cases in various scripting languages like JavaScript, Python, VBScript, Delphi Script. It is available with two licenses and a free trial version valid for 30 days.

### Why use this tool?

TestComplete offers a wide range of test automation capabilities. Some of them are listed below

- **Keyword Testing:** Using the built-in keyword driven test editor testers can develop Keyword driven frameworks with ease
- **Scripted Testing:** Testers can write test scripts from scratch or modify recorded ones in a built-in editor
- **Test Record and Playback:** Provides the basic mechanism of record and playback for test creation. The recorded test cases can be modified as needed
- **Integration to Bug Tracking Software:** Integrates with various bug tracking software such as jira, Bugzilla, etc. It can be used to modify or create items in bug tracking software using issue tracking template
- **Data Driven Testing:** Easy data extraction from CSV files, database tables, Excel sheets, etc.
- **Test Visualizer:** Captures screenshots during test execution allowing us to differentiate between expected and actual screens.
- TestComplete recognizes objects and controls in tested applications and offers special commands for simulating user actions with them. It also offers specific checkpoints that let you easily verify the application state during the test run.
- If the built-in means are insufficient for simulating user actions on the tested application or checking the application state, you can take advantage of accessing the application's internal objects, methods and properties to perform the needed tasks.

### Installation of TestComplete

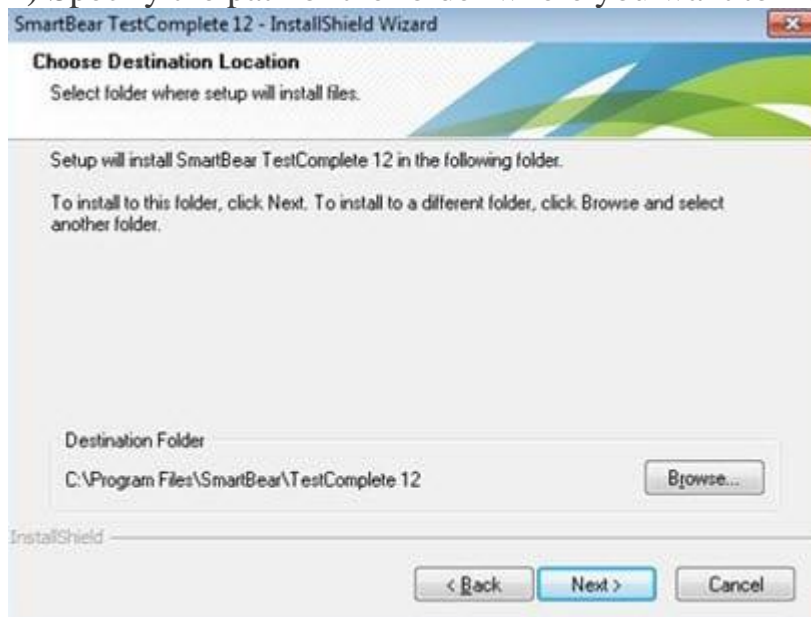

#### Download

[Download TestComplete Free Trial | SmartBear](#)

TestComplete can be downloaded from the official SmartBear .

After downloading, follow the steps to install TestComplete

- 1) Double-click on the downloaded TestComplete setup package. Installation of the software will start and license agreements will be displayed.
- 2) Specify the path of the folder where you want to install the software.

- 3) Now, a welcome dialog is displayed asking to activate a license, we can start by clicking a 30-day trial license.

- 4) After this process restarts the computer, we are finished the process of installing TestComplete.

Creating your first project in TestComplete

Launch the application and you will see the start page.

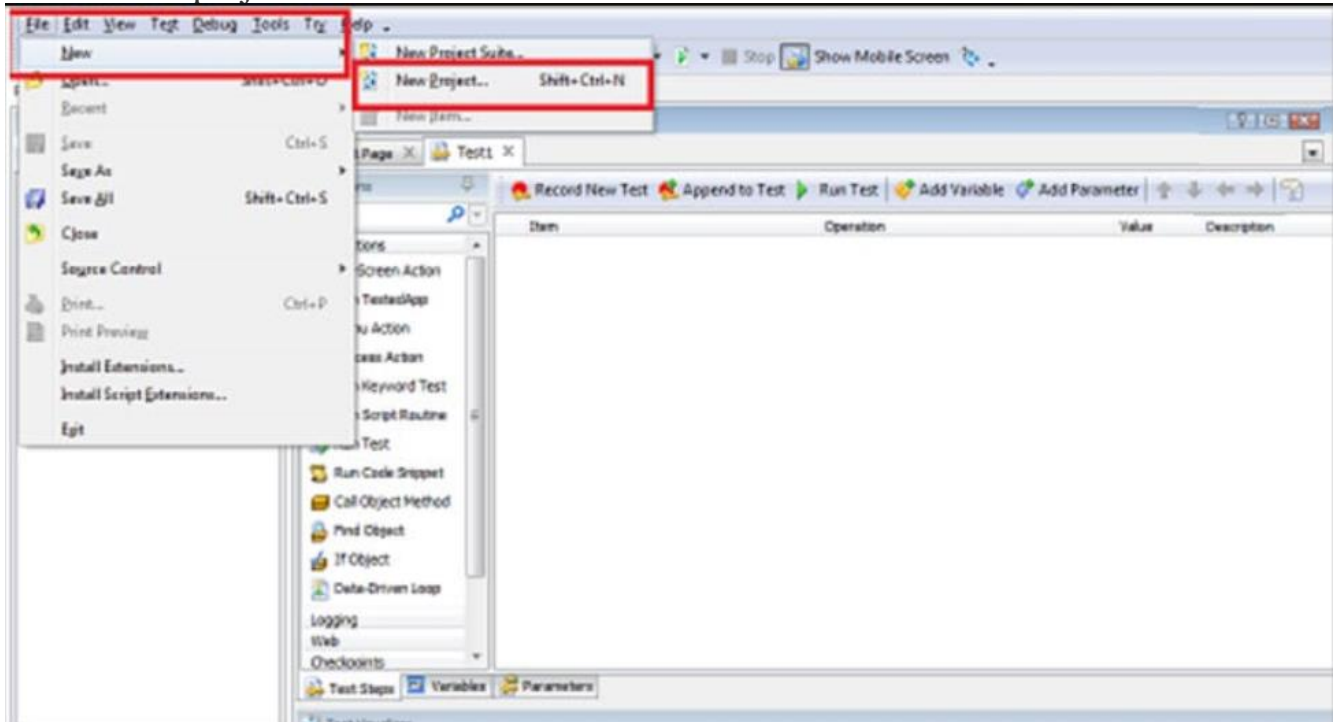

## TEST COMPLETE TOOLS

**Demo application:**

**Desktop application using calculator.**

Step:1

Create new project.

**Follow these steps to create a new project.**

- 1) Go to File menu.
- 2) Click New option from the menu.
- 3) Click New Project option.

## TEST COMPLETE TOOLS

### New project file:

New Project

Enter project attributes

Project name: \*

TestProject1

Project location: \*

C:\Users\91876\Documents\TestComplete 14 Projects\test\

☐ Create a new project suite

Scripting language: \*

JavaScript

Select language for code snippets and script tests. This cannot be changed after project creation.

Optional:

☐ Use XPath and CSS selectors for web objects (required for cross-platform web tests) ?  
Create tests to be run on Windows, macOS, Linux, Android, and iOS.

☐ Tested application (recommended for desktop and BitBar mobile tests)  
Add an application executable and configure it for testing.

☐ BDD files  
Connect to a CucumberStudio project or import local feature files.

? [Learn more about these settings](#)

Next > Finish Cancel

### 2. choose the language:

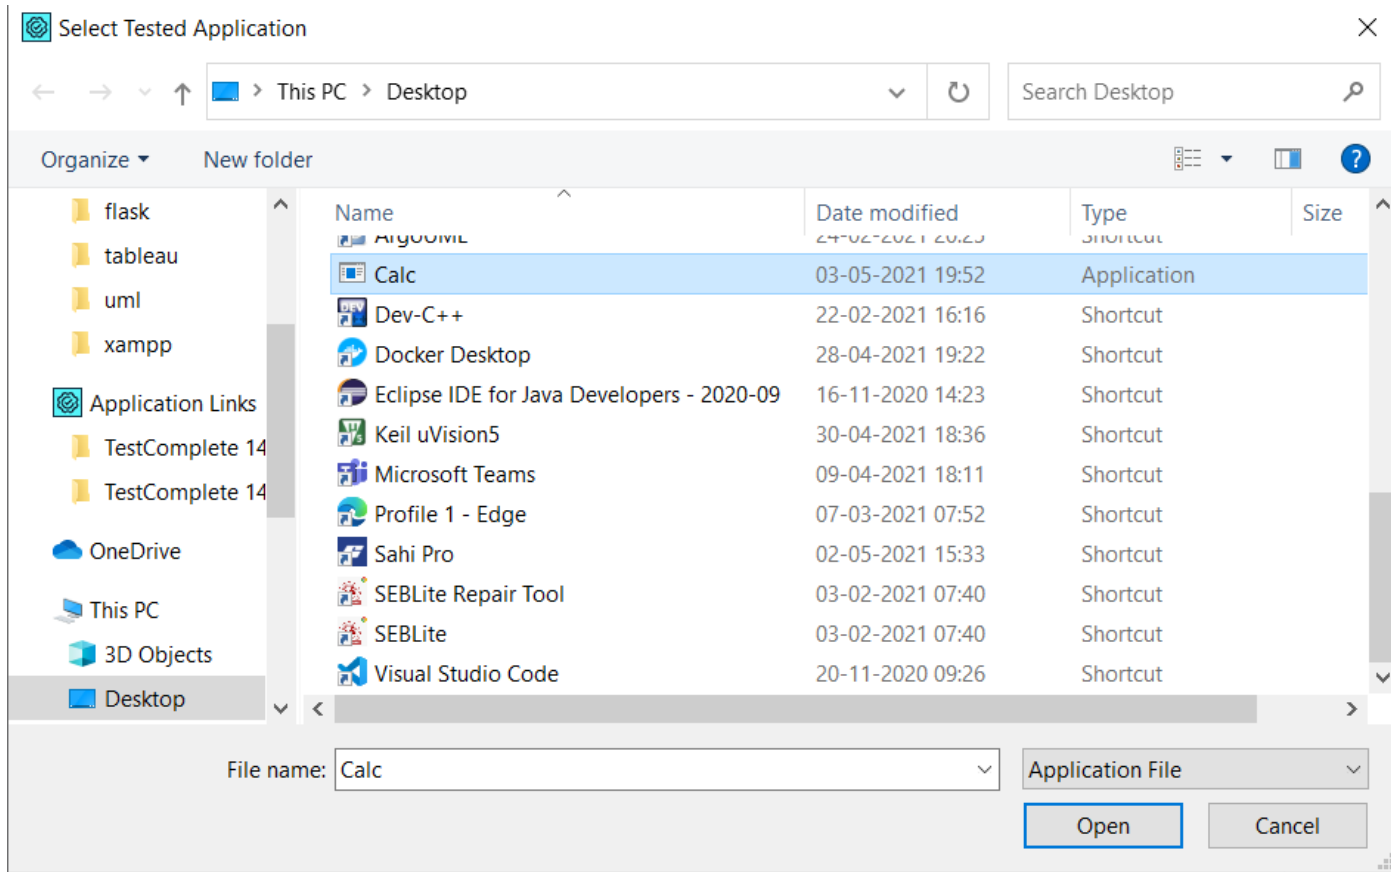

You selected tested application desktop and next.

#### Optional:

- ☐ Use XPath and CSS selectors for web objects (required for cross-platform web tests) ?  
Create tests to be run on Windows, macOS, Linux, Android, and iOS.
- ☒ Tested application (recommended for desktop and BitBar mobile tests)  
Add an application executable and configure it for testing.
- ☐ BDD files  
Connect to a CucumberStudio project or import local feature files.

## TEST COMPLETE TOOLS

3.you select application of the file

- Using Calculator application used in desktop.
- Change the name of file Calc.
- Select the application Calc.

## TEST COMPLETE TOOLS

4.And select folder name:

New Project

Specify a tested application to include in your project

**Desktop**

**Mobile**

Application file:\*

C:\Users\91876\Desktop\Calc.exe

☐ Start application on recording

Command-line parameters:

Working folder:

C:\Users\91876\Desktop\Testcalc\simple

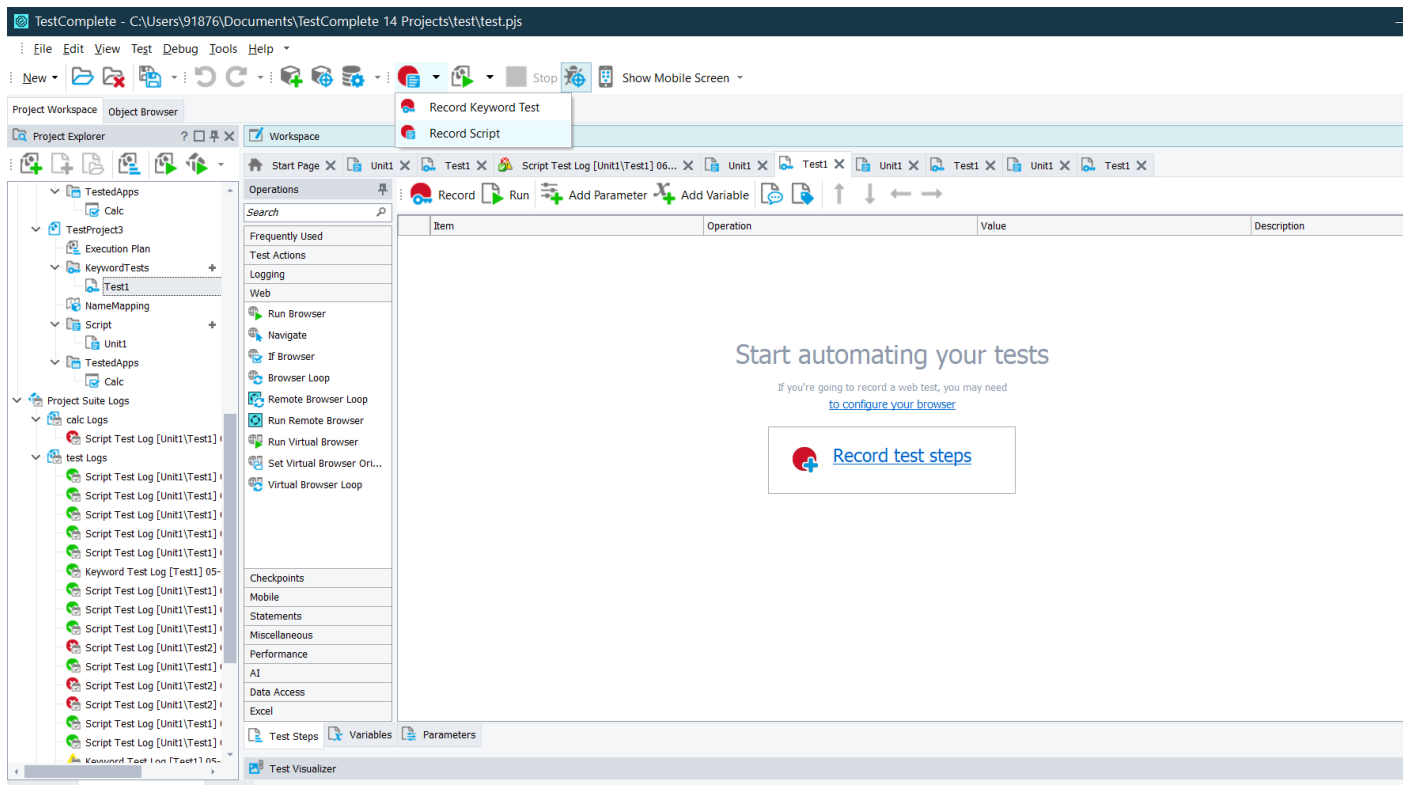

? [Learn more about these settings](#)

< Back Finish Cancel

- Application file calc .exe .
- Working folder name .
- Select the folder on the file and save the application.
- Finish the button.

## TEST COMPLETE TOOLS

### 5. Go to Record script

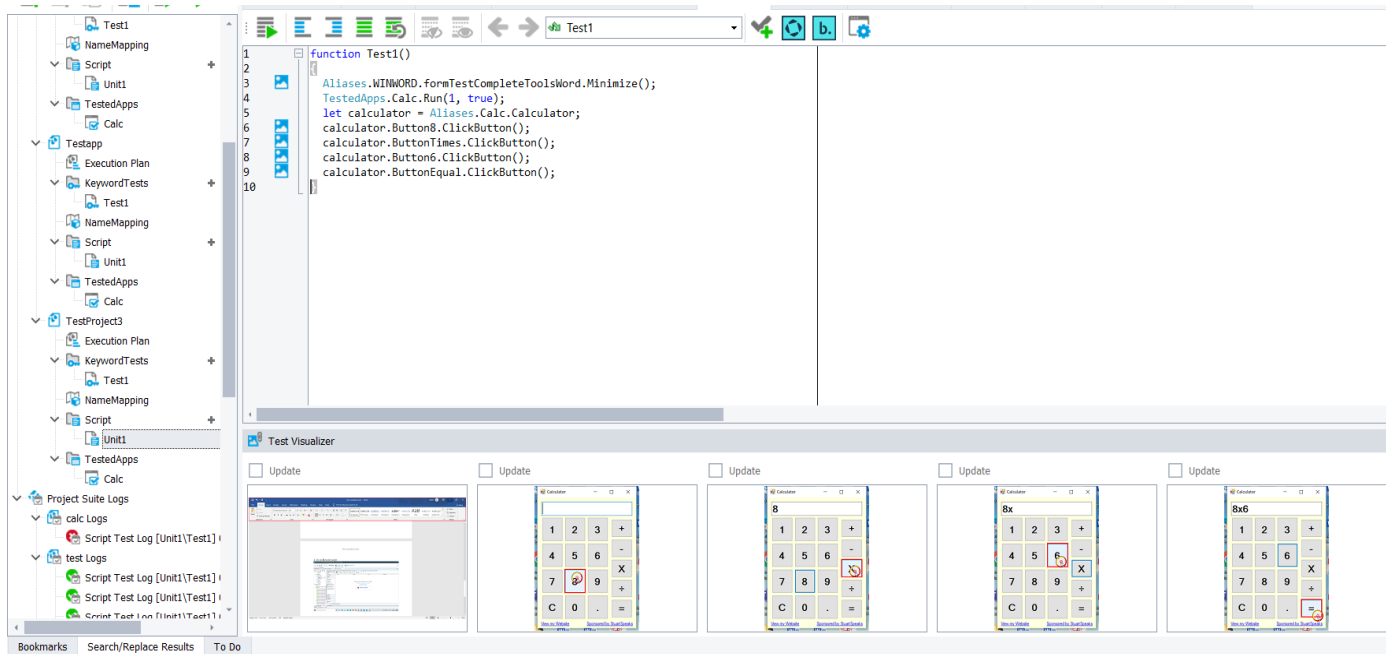

- Record Script using record in the application.
- Record calculator application .
- Record the application and stop save and the file

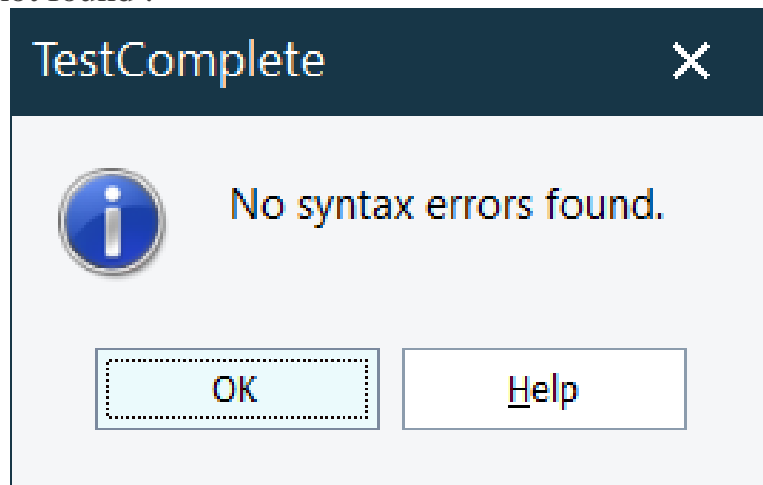

## TEST COMPLETE TOOLS

### 6.Script the file:(code)

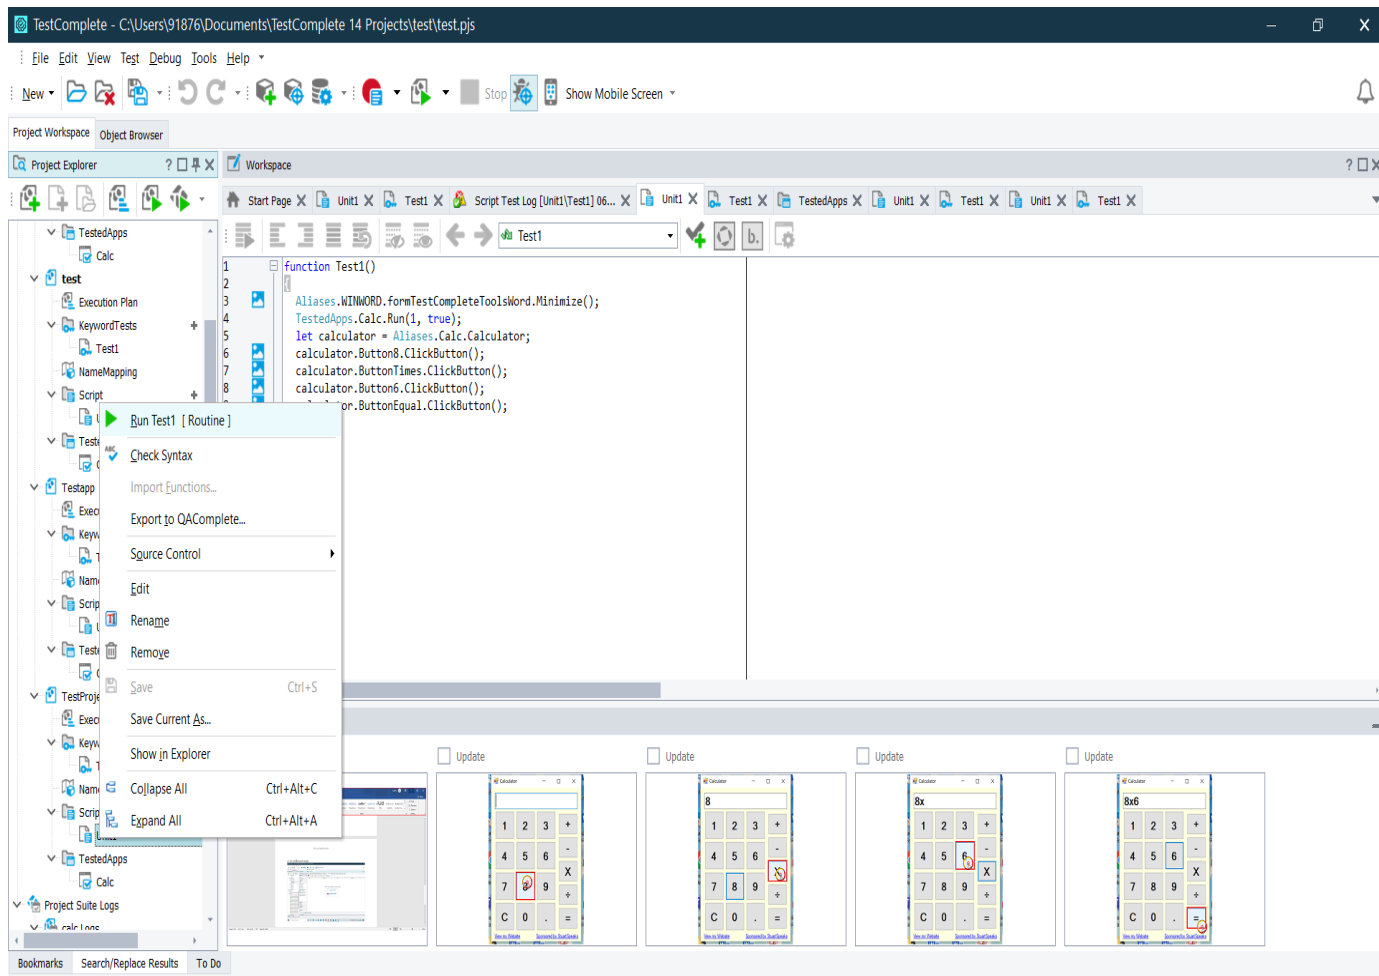

### 7.Check the syntax:

Error not found :

## TEST COMPLETE TOOLS

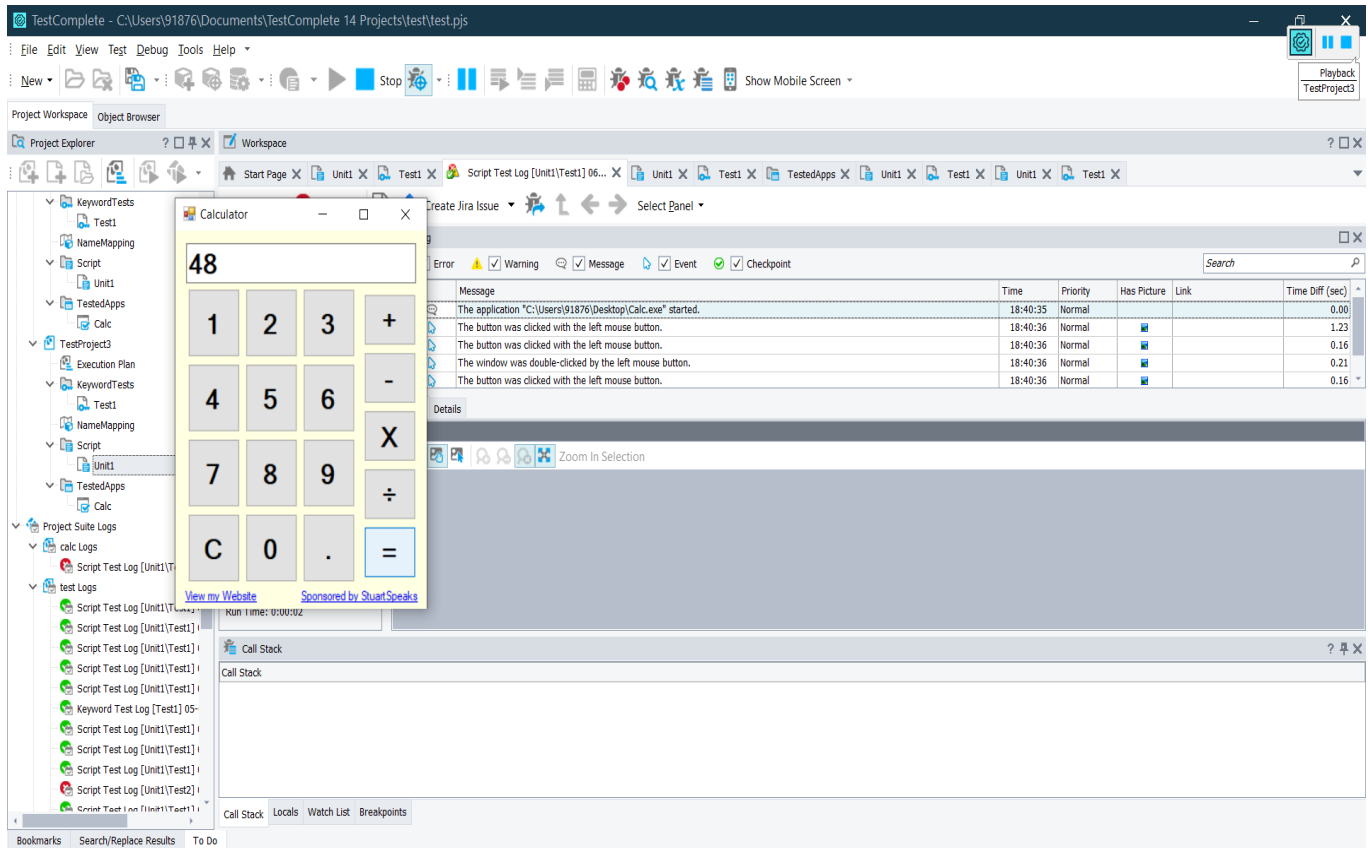

### 8.Script left click and test routine run the program

- Run the program in Run Test1.
- Repeated in checking calculator application
- What are the input given correct or not .

## TEST COMPLETE TOOLS

### 9.Success to run calculator in the program desktop:

- Input given 8 multiply 6 .
- The process run the process.
- Total result. 48.
- Success to run

## TEST COMPLETE TOOLS

### 10.Check point green tick(checkpoint ) Success to run
